

PRIMARY CARE NETWORKS HEALTH AND CARE PROFILE Version 1.5

Nottingham City East PCN

Prepared by Nottinghamshire County Council and Nottingham City Council, Public Health Intelligence

Purpose of this profile

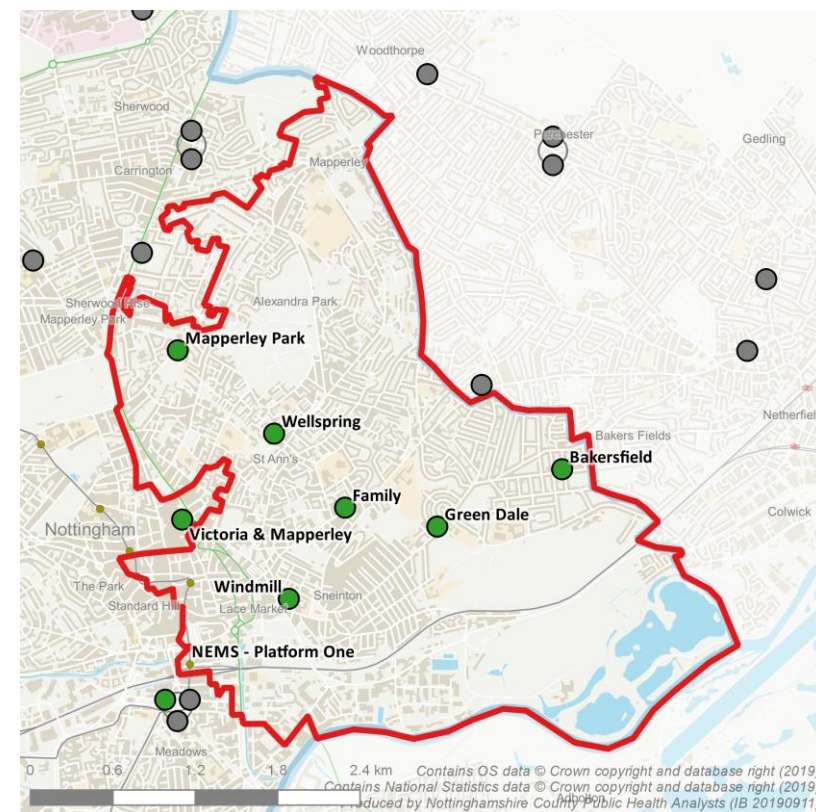

- These profiles are a detailed view covering the various aspects of the health, wellbeing and social care of the different Primary Care Networks (PCNs)
- They are intended to help inform the needs of the local population, to assist and support the planning of local services
- They will allow organisations and teams working in PCNs to develop tailored approaches to engagement and communications and understand issues unique to each population
- The intention is that they are conversation starters for local government, health and social services and the community

What does this profile reveal about this PCN

- This PCN is responsible for 17% of the registered patients in Nottingham City ICP making it the largest PCN in this ICP.
- The population age structure is typical of a young population with a higher proportion of young working age adults and fewer elderly people than England. It is more ethnically diverse and more deprived than the ICP.
- Life Expectancy and Healthy Life Expectancy are lower than England; people live shorter lives and are in ill health or disability for longer.
- Prevalence of chronic long term conditions is generally lower than average, though depression, mental health and learning disability are higher than nationally, as is smoking prevalence.
- Primary care disease management (as measured by QOF) is generally as good as England in most disease areas though less good in others such as diabetes and asthma.
- Vaccination uptake rates are poor.

Quick statistics for this PCN

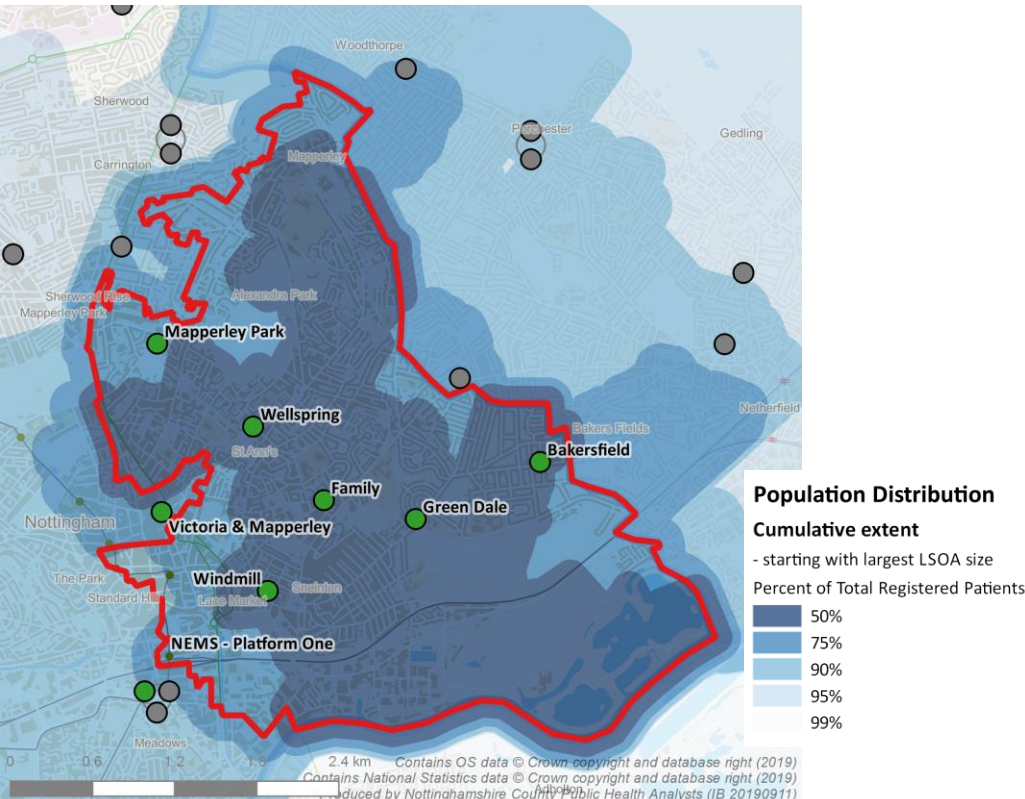

- There are a total of 66,826 patients registered with practices in this PCN; (48% female and 52% male). Of these 69% live within the nominal PCN boundary.
- 78% of the population resident within the PCN boundary are registered with its GP practices.
- Compared to the ICP as a whole, the PCN has a similar proportion of children and elderly people but a smaller proportion of young people age 15-24 years and a greater proportion of working age adults age 30-64 years.
- 2.1% of the population provide 50 hours or more of unpaid care each week, slightly below the ICP and England average.
- BME groups form 35% of the resident population. This is higher than the ICP and England average.
- Asian and Asian British are the predominant group, followed by Black and Mixed ethnicity.
- 6.7% of people rate their health as 'bad' or 'very bad', similar to the ICP and England average.
- The area is more deprived than the ICP, with 62% of the population living in areas defined as the most deprived 20% in England.
- Only 47.4% of school children achieve five A* - C grade GCSEs; lower than the England average (56.6%).
- The proportion of older people living alone is higher than England.
- Use of residential and nursing care for older people is high.
- Incidence of lung cancer is higher than expected compared to England.
- All-age death rates for all causes and selected causes are higher than England.
- The death rate from all causes among people aged under 75 is higher than England.

This PCN boundary covers Sneinton, St Anns and Mapperley to the east of Nottingham and part of the City centre.

- There are 8 GP practices in this PCN (shown in green). Two are just outside the nominal PCN boundary.

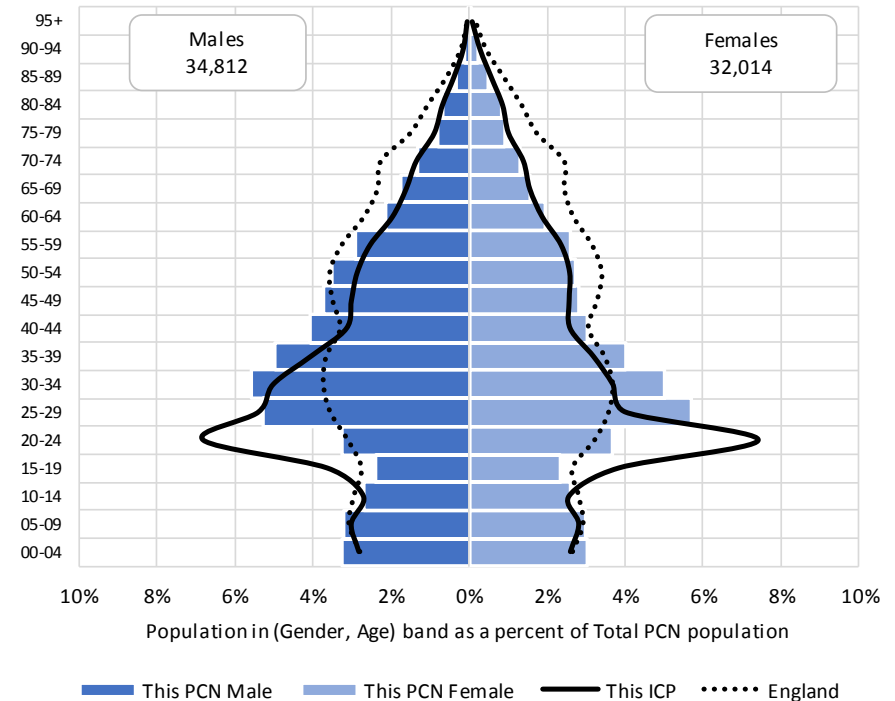

Patient population density

This PCN boundary covers Sneinton, St Anns and Mapperley to the east of Nottingham and part of the City centre.

- There are 8 GP practices in this PCN (shown in green). Two are just outside the nominal PCN boundary.
- 69% of patients registered with the practices live within the boundary.
- 78% of people resident within the boundary area are registered with PCN practices.

Patient population pyramid

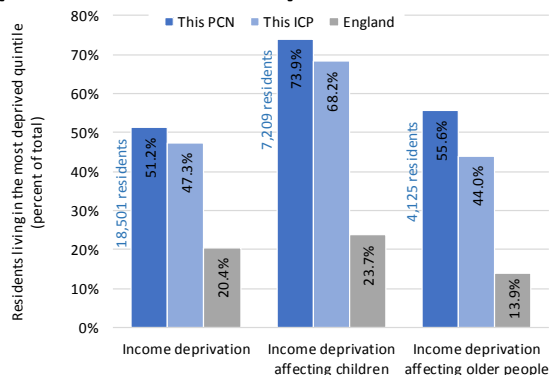

Source: NHS Digital 'Patients registered at GP practices' (April 2019 extract)

This chart shows the April 2019 GP registered population for the PCN, ICP and England.

- There are a total of 66,826 patients registered with the GP practices
- Overall the population profile shows a similar proportion of children and elderly to the ICP, but a lower proportion of 15-24 year olds.
- The proportion of adults aged 25-64 years is higher than the ICP.

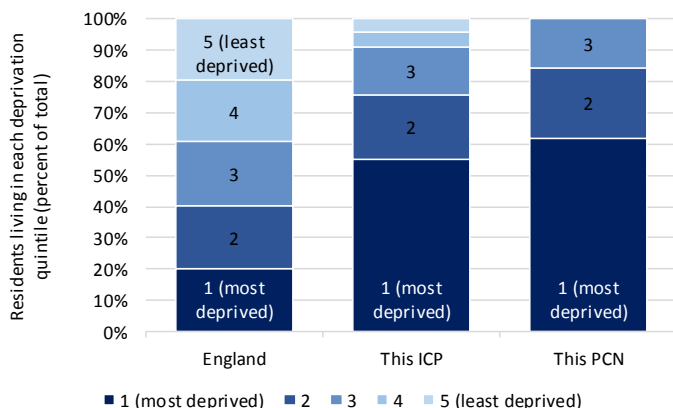

Deprivation (Income Domain)

Source: MHCLG Indices of Income Deprivation (2019) (including ONS Population Estimates 2015), ICP spatial boundary, locally agreed PCN spatial boundaries

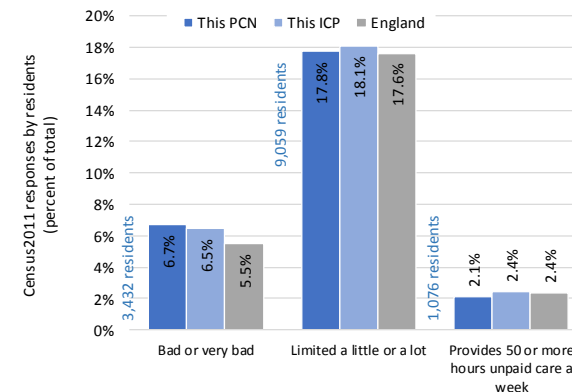

- 73.9% of children in this PCN are living in areas defined as the most deprived 20% in England.
- This is higher than for the ICP and England.

Deprivation (Index of Multiple Deprivation)

Source: MHCLG Index of Multiple Deprivation (IMD) (2019) (including ONS Population Estimates 2015), ICP spatial boundary, locally agreed PCN spatial boundaries

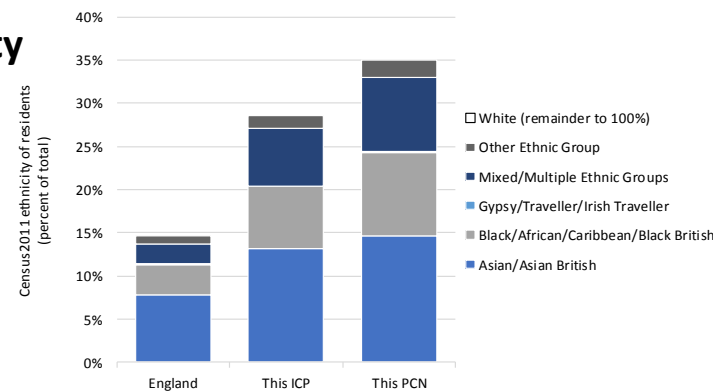

Self reported health and care

Source: Census2011 tables, ICP spatial boundary, locally agreed PCN spatial boundaries

- Compared to the ICP and England, similar proportions of this PCN population report that their health is bad or very bad, or that their daily activities are limited by health or disability.

Ethnicity

Source: Census2011 tables, ICP spatial boundary, locally agreed PCN spatial boundaries

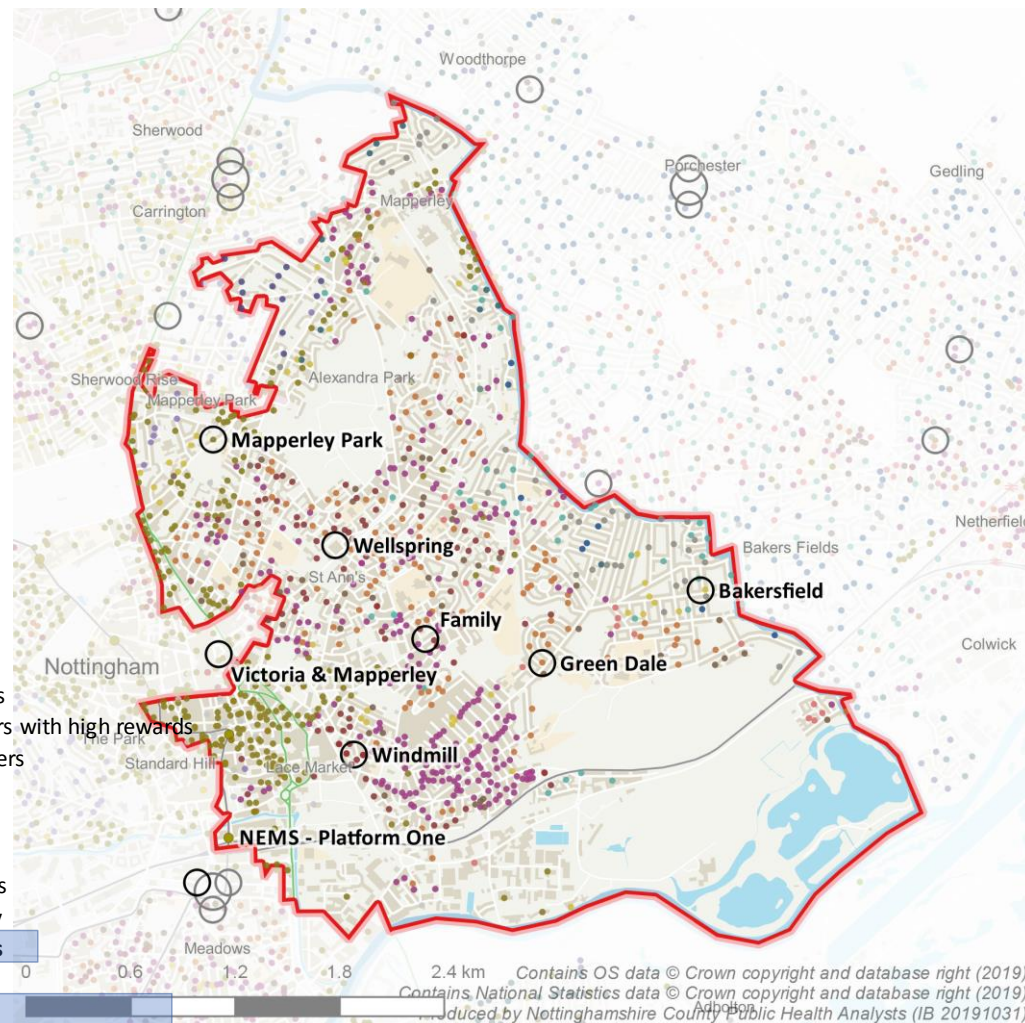

- Over one third of the resident population is from a BME background.
- This is higher than the ICP and more than double the England average.

Mosaic population groups

Mosaic groups are a way to segment the population into 15 groups based on their common characteristics.

- The predominant groups, Group J and L make up just over half of the population. They comprise young people in privately rented accommodation, many in shared houses. Group J tend to live in the city centre and Group L in St Anns.
- Groups M, N, and O with perhaps more limited resources and greater health needs make up 31% of the population. Group M tends to be found in Sneinton and St Anns, Groups N and O are more dispersed across the PCN.

Percent	Group Type Name	One Line Description
0.0%	A Country Living	Well-off owners in rural locations enjoying the benefits of country life
1.0%	B Prestige Positions	Established families in large detached homes living upmarket lifestyles
1.1%	C City Prosperity	High status city dwellers living in central locations and pursuing careers with high rewards
1.2%	D Domestic Success	Thriving families who are busy bringing up children and following careers
1.0%	E Suburban Stability	Mature suburban owners living settled lives in mid-range housing
4.7%	F Senior Security	Elderly people with assets who are enjoying a comfortable retirement
0.0%	G Rural Reality	Householders living in inexpensive homes in village communities
3.1%	H Aspiring Homemakers	Younger households settling down in housing priced within their means
3.7%	I Urban Cohesion	Residents of settled urban communities with a strong sense of identity
23.3%	J Rental Hubs	Educated young people privately renting in urban neighbourhoods
2.3%	K Modest Traditions	Mature homeowners of value homes enjoying stable lifestyles
27.6%	L Transient Renters	Single people privately renting low cost homes for the short term
16.5%	M Family Basics	Families with limited resources who have to budget to make ends meet
4.5%	N Vintage Value	Elderly people reliant on support to meet financial or practical needs
9.7%	O Municipal Challenge	Urban renters of social housing facing an array of challenges

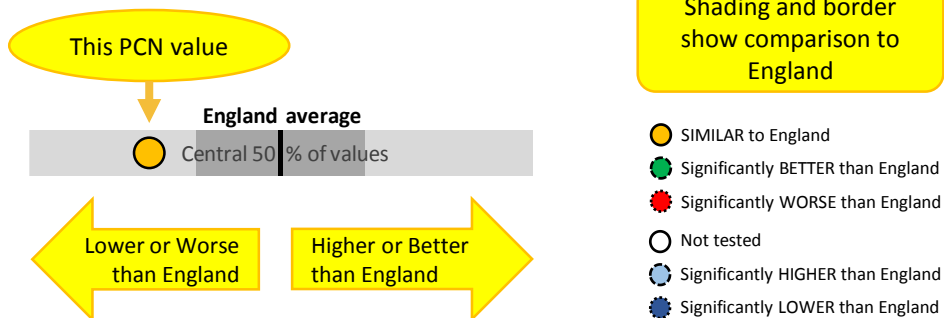

Public Health England Local Health Indicators

Local Health is a collection of health information to help understand the health and wider determinants of health of populations in small geographical areas.

Local Health contains indicators relate to Population and demographic factors, Wider determinants of health and Health outcomes and are split across four domains:

- Our Community
- Behavioural risk factor and child health
- Disease and poor health
- Life expectancy and causes of death

Values for PCNs are estimated using the small area data and are compared to the overall England value. The spine chart shows how these values vary in relation to other small areas in England.

These indicators are based on resident populations which should not differ greatly from the registered population unless the registered population has a wide spatial distribution.

Features to note for this PCN

- Life expectancy at birth for Females is higher than for Males
 - Life expectancy for Males in 2013-17 was 76.5 years
 - ... and for Females was 80.3 years
- Females live in poor health for longer than Males
 - The gap between Life expectancy and Healthy life expectancy in 2009-13 was 19.3 years for Males
 - ... and 23.2 years for Females.
- Life Expectancy and Healthy Live Expectancy for both men and women is shorter than the England average.
- Generally, the population is relatively deprived and in poor health; local health indicators are generally worse than or similar to England averages.
- Areas where this PCN fares better or as well as England despite higher levels of deprivation include:
 - Teenage motherhood
 - A&E attendances and admissions for injuries in children
 - Smoking prevalence at age 15 years
 - Emergency hospital admissions (all ages)
 - Incidence of breast, colorectal and prostate cancer
 - Emergency admissions for hip fracture
 - Proportion of people with long term limiting illness or back pain.

Life expectancy and causes of death

Social care measures

These are local breakdowns of datasets relating to the Short and Long Term Support (SALT) submissions for the national collection. Two years of data are combined (2017/18 and 2018/19) and include cross-border City and County residents.

Measure 1: Adults (aged 18+) supported in long-term residential and nursing care at the year-end 31 March

1A: Younger adults (aged 18-64)

1B: Older adults (aged 65 and over)

82.3 per 100,000 residents
(65 clients)

2,627.1 per 100,000 residents
(295 clients)

This rate is lower than England

This rate is higher than England

England: 122.9
per 100,000 residents

England: 1,478.7
per 100,000 residents

Measure 2: Adults (aged 18+) accessing long-term community support at the year-end 31 March

2A: Younger adults (aged 18-64)

2B: Older adults (aged 65 and over)

727.6 per 100,000 residents
(575 clients)

4,230.1 per 100,000 residents
(475 clients)

This rate is higher than England

This rate is higher than England

England: 630.3
per 100,000 residents

England: 2,327.7
per 100,000 residents

Measure 3: Long-term support needs of adults (aged 18+) met by admission to residential and nursing care homes

Lower rates are considered better

3A: Younger adults (aged 18-64)

3B: Older adults (aged 65 and over)

31.6 per 100,000 residents
(25 clients)

890.6 per 100,000 residents
(100 clients)

This rate is worse than England

This rate is worse than England

England: 13.9
per 100,000 residents

England: 582.8
per 100,000 residents

Measure 4: Proportion of older people (65 and over) who were still at home 91 days after discharge from hospital into reablement / rehabilitation services

Higher percentages are considered better

4: Older adults (aged 65 and over)

92.1 percent
(35 clients)

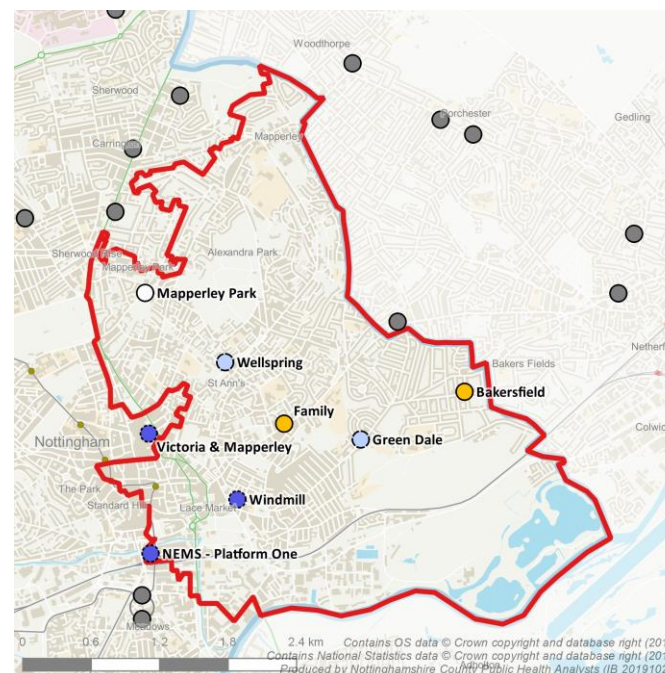

This percentage is similar to England

England Value: 82.7 percent

Quality outcomes framework (QOF)

- The QOF is a performance, management and payment system for General Practices.
- GPs keep a record of people with specific diseases such as
 - chronic chest disease (COPD)
 - diabetes
 - heart disease (CHD)
 - mental health
 - dementia
 - atrial fibrillation
 - asthma
 - learning disability
 - osteoporosis
 - palliative care, and
 - smoking
- These registers are used to calculate recorded disease prevalence, which is compared to England in these profiles.
- The data in this profile is for the year 2018/19. The figures may be under estimates due to people not presenting to their GP, not being diagnosed or not being recorded.
- No data was available for 1 practice.

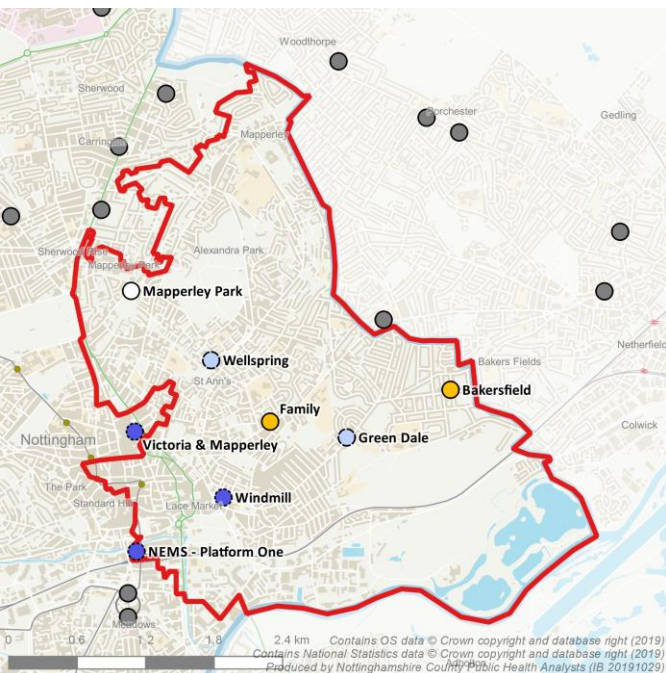

COPD prevalence

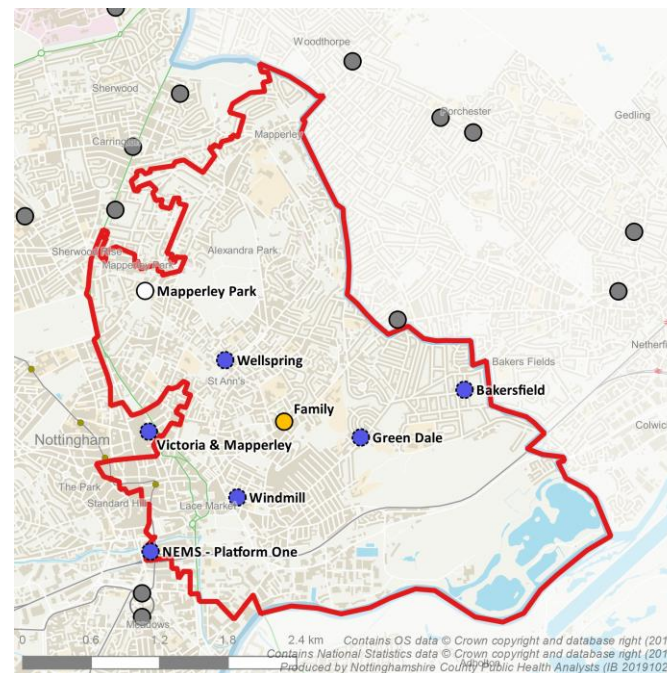

COPD is the name for a collection of chronic chest diseases. People with COPD have difficulties breathing due to a narrowing of their airways. Smoking is the main cause of COPD – more than 4 out of 5 people who develop the disease are, or have been smokers.

- The PCN population had a similar prevalence of COPD (2.0%) to England (1.9%).
- 97.1% of patients had their diagnosis confirmed by post bronchodilator spirometry, similar to the England average of 96.3%.
- 77.2% of patients had received an influenza vaccination; similar to the England average of 78.4%.

Diabetes prevalence

CHD prevalence

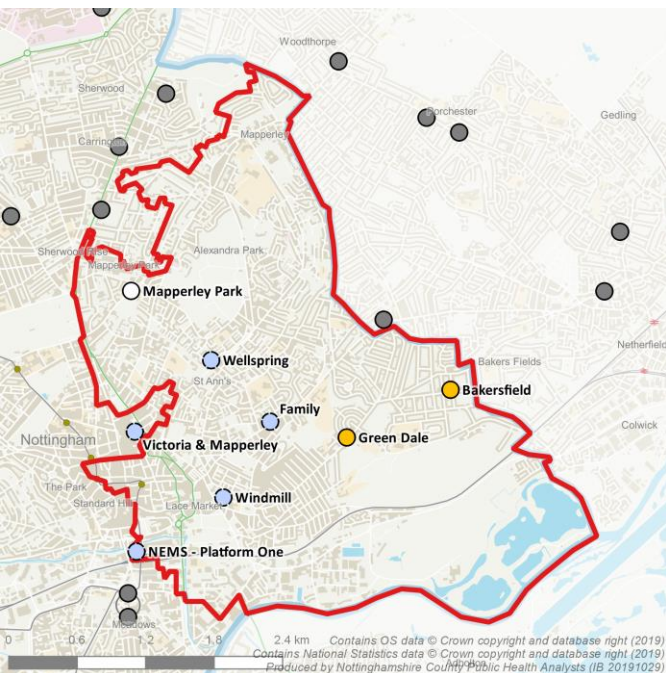

Type 2 diabetes is linked to many health complications such as heart disease, eye problems, kidney disease and problems with circulation. It is important that diabetes is diagnosed early and well managed.

- The PCN population had a lower prevalence of diabetes (6.3%) than the England population (6.9%).
- 64.3% of patients had well controlled (HbA1c of 64mg or less) blood sugar, worse than the England average.
- The uptake of influenza immunisation (72.9%) was similar to England.
- Good blood pressure control was lower than England.

Coronary heart disease is caused by a build up of fatty deposits on the walls of the arteries around the heart (coronary arteries). Smoking, high blood pressure, lack of exercise, diabetes or being overweight or obese all increase the risk of CHD.

- The PCN population had a lower prevalence than the England population; 2.3% compared with 3.1%.
- 83.3% of CHD patients had well controlled blood pressure, similar to the England average (80.6%).
- 81.8% of CHD patients had taken aspirin or anti-clotting medication. This is similar to the England average (79.6%).

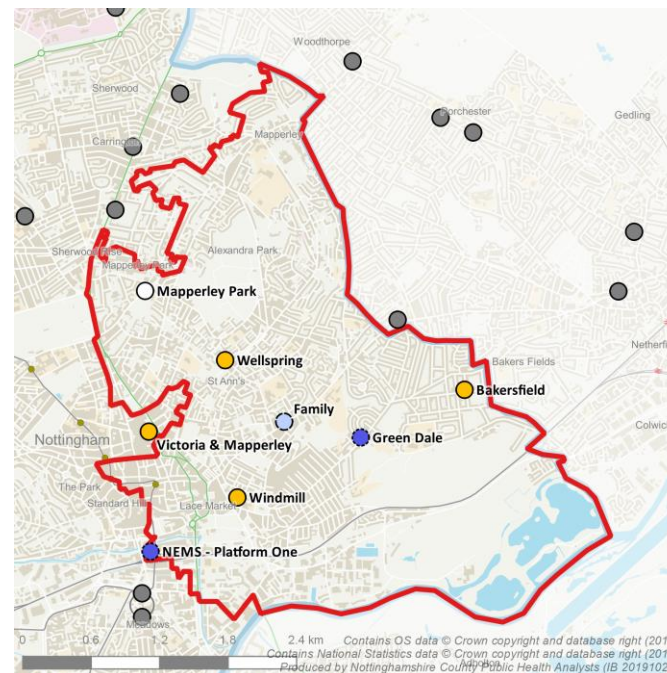

Mental health prevalence

This includes all patients with a diagnosis of schizophrenia, bipolar affective disorder or other psychoses. Mental illness can result in high levels of disability and a reduced quality of life for patients, families and carers.

- The PCN population had a higher prevalence than England; 1.6% compared to 1% for England.
- 75.1% of patients had a comprehensive care plan. This is similar to England (70.5%).
- 93.7% of eligible women in this group had a cervical smear in the previous 5 years, comparable to 94% in England.

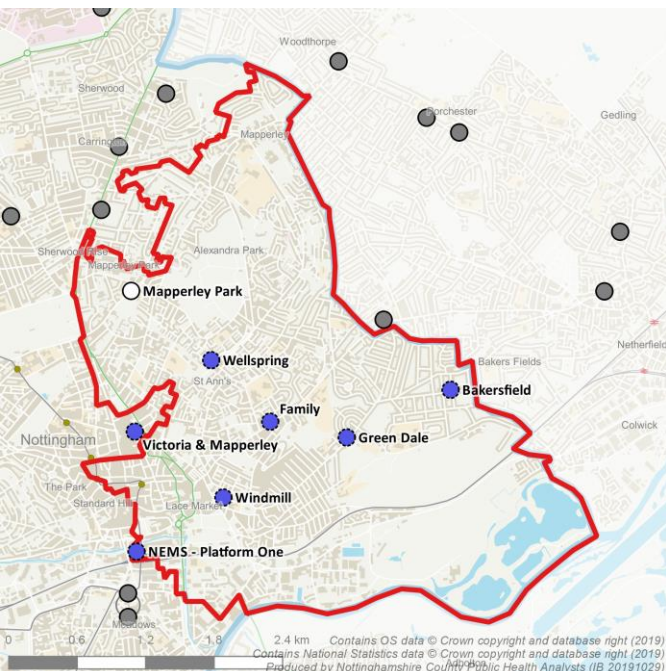

Dementia prevalence

Dementia affects the brain and its abilities. This includes problems with memory loss, thinking speed, mental agility, language, understanding and judgement.

- The PCN population had a lower prevalence than England; 0.6% compared to 0.8% for England.
- 70.2% of patients had a face-to-face review in the previous 12 months. This is similar to the England average of 70.3%.
- 85.6% of patients newly diagnosed with dementia had records of key test results soon after diagnosis; similar to the England average (83.7%).

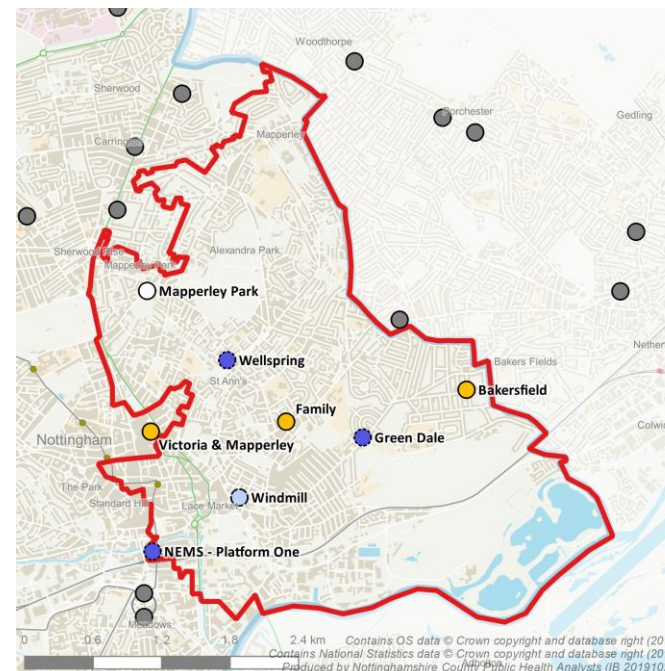

Atrial fibrillation prevalence

AF is the most common sustained cardiac arrhythmia. Men are more commonly affected than women and the prevalence increases with age. In people who have had a stroke, concurrent AF is linked with a higher rate of mortality, disability, longer hospital stay and lower rate of discharge home.

- The PCN population had a significantly lower prevalence than England; 1.1% compared with 2.0%.
- The proportion having their risk of stroke assessed (76.8%) was lower than the England average (82.1%).
- Anticoagulant treatment of at risk patients (77.4%) was lower than the England average (81.1%).

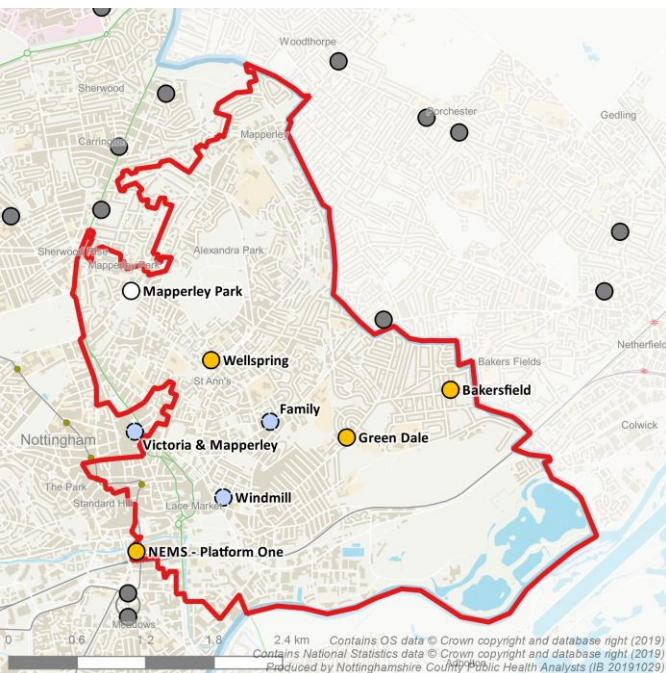

Asthma prevalence

Asthma is a common respiratory condition which responds well to appropriate management and which is principally managed in primary care.

- The PCN population had a lower prevalence (5.6%) than England (6.0%).
- Recording of smoking status (age 14-19 years) was lower than the England average; 74.7% compared to 78%.
- Asthma review had been carried out in 89.2% of patients; this was lower than the England average (91.6%).
- Recorded variability/reversibility (87.4%) was similar to the England average (88.5%).

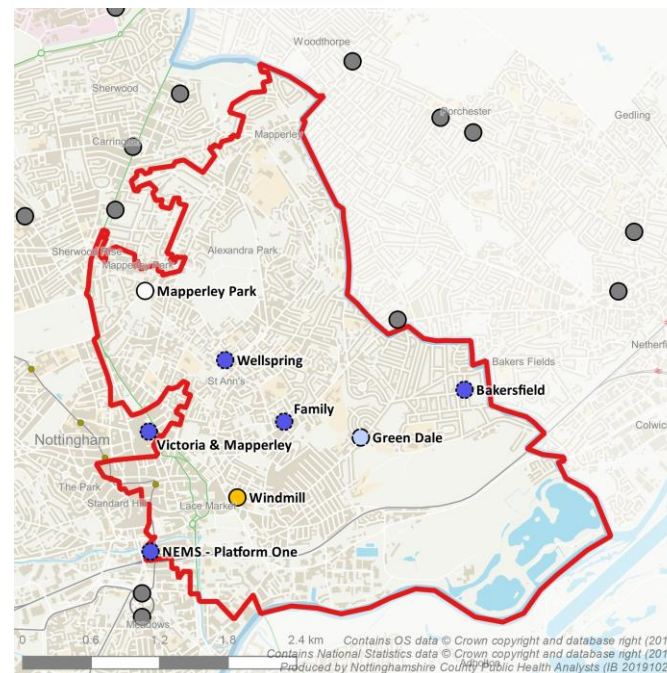

Learning disabilities prevalence

People with learning disabilities are among the most vulnerable and socially excluded in our society. Virtually all people with learning disabilities are now living in the community and depend on general practice for their primary care needs.

- The PCN population had a prevalence of 0.6%; higher than the England average (0.5%).

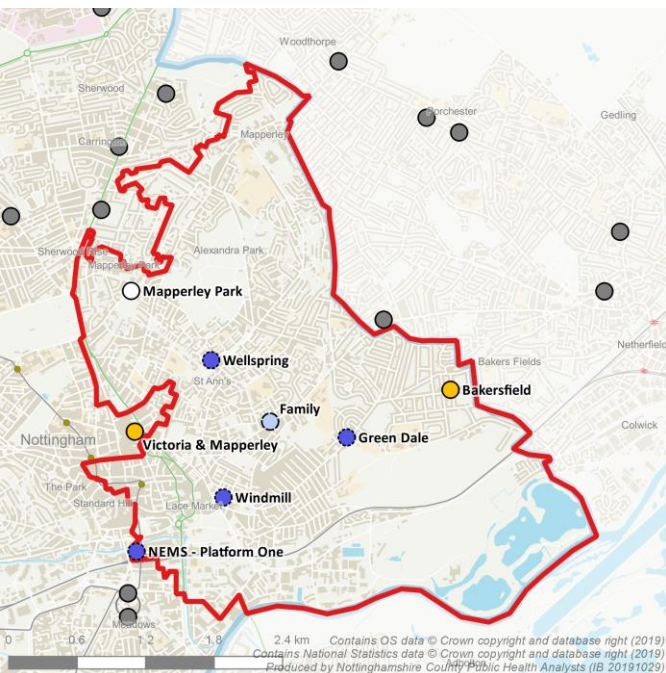

Osteoporosis (secondary prevention) prevalence

Osteoporotic fragility fractures can cause substantial pain and severe disability and are associated with decreased life expectancy. They occur most commonly in the spine, hip and wrist. They also occur in the arm, pelvis, ribs and other bones.

- The PCN population had a significantly lower prevalence (0.5%) than England (0.8%).
- The proportion of people age 50-74 treated with bone sparing agent (57.8%) was lower than the England average (68.1%).
- The proportion of those treated that were age 75 or over was similar to England; 90.2% compared with 90.6%.

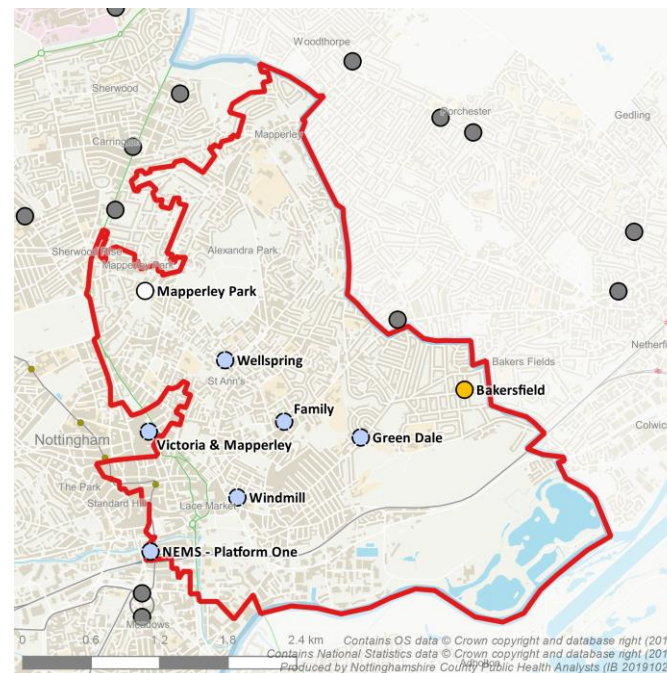

Palliative care prevalence

Palliative or end of life care is the active total care of patients with life-limiting disease and their families by a multi-professional team.

- The prevalence of patients receiving palliative care is significantly lower than the England average; 0.3% compared to 0.4%.

Smoking prevalence

The percentage of patients age 15 and over with current status of smoker recorded in last 2 years. High risk smokers are those with any combination of the following conditions: CHD, PAD, stroke or TIA, hypertension, diabetes, COPD, CKD, asthma, schizophrenia, bipolar affective disorder or other psychoses whose notes record smoking status in the preceding 12 months.

- The PCN population had a significantly higher smoking prevalence than England; 24.9% compared with 16.6%.
- A significantly lower proportion of high risk smokers were offered support and treatment in the last 12 months (76%) compared to the England average (79.7%).

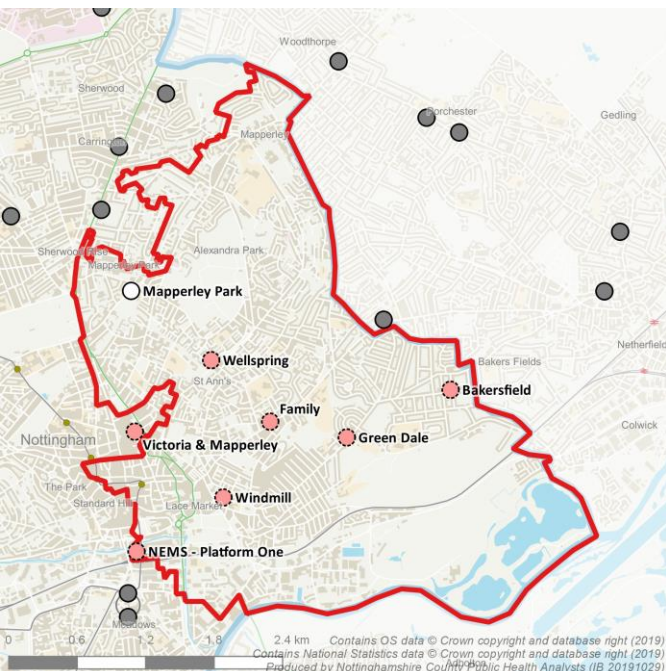

QOF Prevalence - PCN overview - all QOF disease registers

DTAP 5yrs immunisation uptake

MMR uptake

Diphtheria is a highly contagious bacterial infection that mainly affects the nose and throat.

- The PCN practices achieved immunisation uptake at age 5 of 79.4% during 2018/19, not reaching 90% coverage.
- None of the 8 practices reached 90% coverage (data not available for 1 practice).

MMR is a combined vaccine that protects against three separate illnesses; measles, mumps and rubella (German measles). These are highly infectious conditions that can have serious, potentially fatal, complications.

- The PCN practices achieved immunisation uptake at age 5 of 82.7% during 2018/19, not reaching 90% coverage.
- Only one of the 8 practices reached 90% coverage (data not available for 1 practice).
